INTRODUCTION

Understand The Different Types of Smoke Alarms

Units can be classified according to the type of power supply and the way that they detect smoke. Please review the chart on the following page to determine the type of Smoke Alarm that you have and the steps that you should take to maintain it. The chart on the following page provides the minimum requirements for smoke alarm installation that are required by the National Fire Protection Association (NFPA) Standards 72 and 70.

REGULAR MAINTENANCE

It is important to test your Smoke Alarm every month to make sure it's working properly. The National Fire Protection Association (NFPA) recommends that you do this at least once a month, so that you can have time to replace the battery if required.

To test your Smoke Alarm, simply press the “Test” button on the Smoke Alarm. If the Smoke Alarm is not working properly (if it beeps, but does not sound), you should replace the battery immediately. If the Smoke Alarm is not working at all (if it does not beep or sound at all), you should replace the Smoke Alarm immediately.
